Scaffold selection and erection

Scaffolding, although taken for granted as an elevated work platform, is only as good as it is erected. Competent erectors must be trained in the recognition of their surroundings, the well-being of their crew and the appropriate type and end-use of the scaffold. This competent person must also provide direction to the installation crew throughout the process. Attendees will learn to evaluate job-site hazards which affect the scaffold erection; identify the correct components and proper sequence for scaffold erection; and recognize when to involve the services of an engineer. The presenter will use an erected scaffold to demonstrate the selection and erection process.
