Tame the sleeping giant - compressed gas safety for all industries

At over 2200psi, compressed gases are a deadly accident waiting to happen. It is imperative for employees to understand the proper methods of safe handling, storage and transportation of compressed gasses. Attendees will be able to list the proper methods of safe handling, storage and transportation of compressed gasses; explain the following course elements; accident case histories; types of compressed gases, compressed gas health hazards; compressed gas safety hazards; marking of cylinders; safe storage requirements and positioning; safe handling and movement of gas cylinders; proper regulator connection and inspection procedures; leak detection; recognition of hazards; and Compressed Gas Association notices. Presented by David Maloney, owner/trainer, CGS Safety Training Inc.
