Hidden asbestos hazards in public buildings: Dealing with asbestos

Many building materials found in public buildings may contain asbestos. Hidden asbestos hazards in public buildings can create environmental issues, public and employee health concerns, and owner liability issues during routine building maintenance procedures, building renovations, and/or building demolitions. Owners are often unaware of the presence of asbestos and the precautions needed as part of a building management and employee safety process. Attendees will learn to recall the history of asbestos use, identify health issues and regulatory framework; describe identification, locations, and proper handling of asbestos; and list how/when to dispose of asbestos containing materials.

Presented by Larry Cogley, technical project manager, Burgess & Niple
