***Predictive modeling in workers' compensation***

There are no "crystal balls" when it comes to predicting the frequency or severity of injuries in your workplace. However, there are identifiable trends, and knowing what they are can assist you in managing risk. Predictive modeling attempts to take proactive measures in addressing the likelihood of injuries and ways to manage rising health-care costs associated with the treatment of workers' compensation claims. This session also looks at changing trends in health-care management. Attendees will be able to describe the ways employers can take an active role in the treatment of injured workers; identify red flags or barriers to claim resolution; and develop a plan to react to these issues.

Presented by David Kessler, medical director, CompManagement Health Systems, a Sedgwick CMS Company
